- [Login](#)

Main Page

In theory these buttons would interact with the graph, with the user being able to zoom in on points, refresh the graph back to its original view, scroll along the axes, and save a picture of where they move to. These controls come built in with matplotlib. Other than that, this is a basic generated matplotlib graph and interface that I have customised slightly for the needs. The buttons prev and next will change screens to the previous or next uploaded data, along with its summary and possibly chat box.

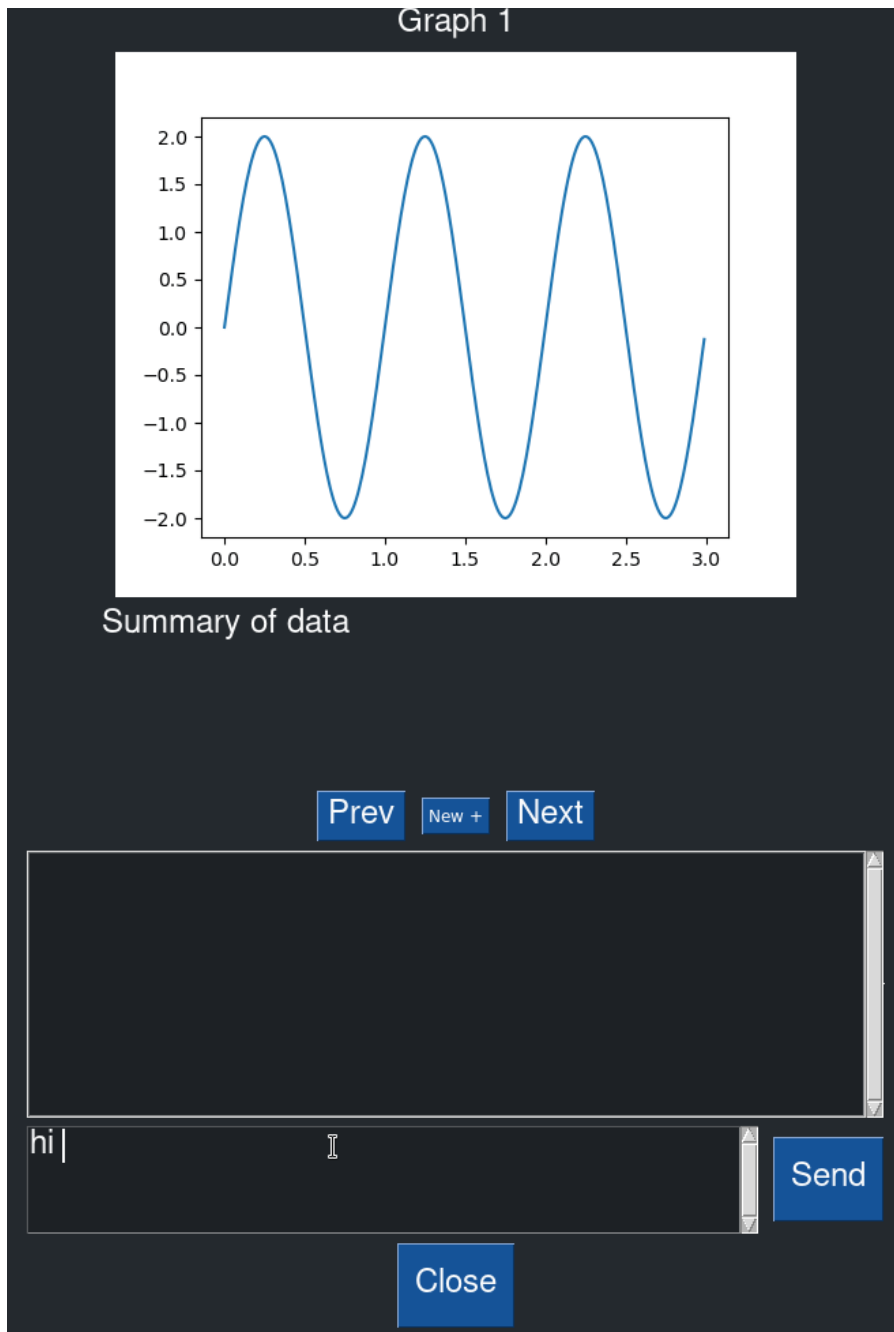

Navigation

These are the buttons which allow you to move from screen to screen

↑

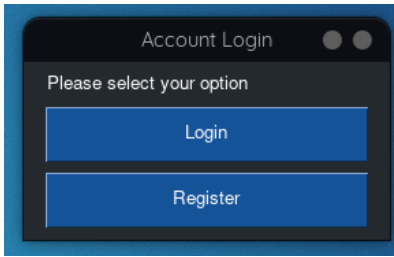

Chat

The user inputs the text they want to send and then either presses enter or clicks the send button. this gets sent to the chat. Curenrtly it is cheesing it and i manually assigned my name to the messages by hardcoding.

↑

Login Page

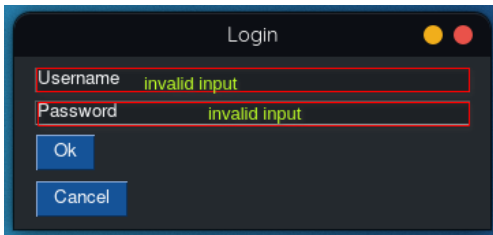

This is a modal window that pops up when you run the program. So you cannot interact with the main window until you login or register. Upon clicking either button, a new modal window appears. All these windows are currently coded and working in the program, aside from the error windows which were made in an editing program. The only thing that is not done is any kind of storage for the user/pass and validation to check correct logins. So the screens are just placeholders without function right now.

Login

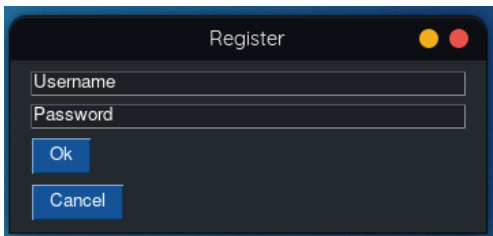

The login window. It remains unstyled for now

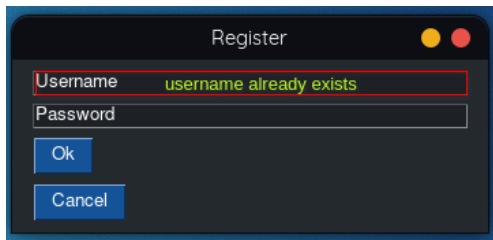

Concept of an error message that would appear if the user does not input a valid username or password

Register

Register window which appears as a modal when you click the register button

Concept of error that might appear while registering, if a user tries to input a taken name
